

PARTICIPANT HANDBOOK

Build a brand that can think.

A detailed problem statement and a complete guide to building, demonstrating and submitting an AI-powered brand intelligence product.

Presented with the support of Inkloom

Inkloom's sponsorship helps keep participation accessible, supports the event experience and gives builders a serious platform to create and showcase their work. We sincerely appreciate Inkloom's support for the community.

TITLE / PRESENTING SPONSOR

Inkloom

Upcoming AI-powered creative platform for turning ideas into distinctive visual identities.

EARLY-ACCESS CODE

INKLOOM-WCC

inkloom.art

Inkloom is under development. You are not required to integrate Inkloom into your project. The code is a participant launch benefit and visibility asset; redemption timing and benefits follow Inkloom's official instructions.

SECTION 01

Problem statement

Turn an incomplete idea into a coherent, useful and launch-ready brand system using an intelligent AI workflow.

The starting problem

Founders often begin with a single rough sentence, such as: 'I want to create an app that helps students find teammates.' The idea may be useful, but it is not yet a brand. The founder still has to identify the real audience, sharpen the problem, choose a position, define a personality, find a credible name, select a visual direction, establish a voice and prepare a launch.

Your challenge

Build an AI-powered product that transforms a rough product, startup, community or creator idea into a structured and launch-ready brand or identity system. The product must help a user make better decisions - not merely produce a long block of generic text.

The product should help answer

- Who is the product truly for?
- What problem is worth solving?
- What is the clearest value proposition?
- How should the brand feel and behave?
- What naming direction is memorable?
- Which visual language fits the audience?
- What voice and messaging stay consistent?
- How should the brand enter the market?

Core objective

Create a working product in which AI meaningfully improves the reasoning, distinctiveness, consistency or usefulness of brand decisions. Strong projects will expose a clear workflow, allow the user to shape the result and produce outputs that could genuinely help someone launch.

Avoid the one-prompt trap

A weak pattern

Idea entered -> one giant prompt -> one generic answer. A polished interface cannot compensate for shallow reasoning. Break the problem into deliberate stages, preserve context and show how the system improves or checks its own work.

SECTION 02

What a strong product should do

You may design your own architecture. The sequence below is a reference model, not a compulsory screen-by-screen flow.

01	Discover	Interview the user and clarify the idea, problem, audience, goals and constraints.
02	Position	Define the category, differentiator, value proposition and competitive angle.
03	Shape	Develop personality traits, naming territories, voice, tagline and message hierarchy.
04	Visualize	Translate strategy into logo direction, typography, color mood, shapes and imagery.
05	Challenge	Detect cliches, contradictions, bias and audience mismatch; propose better alternatives.
06	Deliver	Produce a consistent brand kit and practical launch assets the user can act on.

Expected output system

- Idea and audience analysis
- Positioning and value proposition
- Brand personality and principles
- Naming directions with rationale
- Tagline and one-line pitch
- Visual design brief
- Brand voice and sample messages
- Consistency or quality checks
- Launch-ready content or assets
- Exportable or shareable final kit

Minimum product expectation

A working experience, not a slide deck

A user must be able to provide an input, interact with the product, trigger the AI workflow and receive a real output. The demo must show that path live. Mock screens may support the explanation, but they cannot replace a working core flow.

SECTION 03

AI workflow and prompt architecture

Use stages because each stage has a distinct job. Store structured results so later stages can build on earlier decisions instead of restarting from zero.

1. Understand the idea

Extract the core problem, target user, context, constraints, value and open questions. Do not begin branding before the problem is understood.

2. Build the personality

Choose three to five traits and justify each one against the intended audience. Include traits to avoid.

3. Challenge generic thinking

Identify cliches, overused startup patterns and weak assumptions. Generate alternatives with stronger reasons.

4. Create visual direction

Translate the strategy into typography, color mood, composition, symbols, image style and concepts to avoid.

5. Test consistency

Check whether name, tagline, voice, visuals and launch message feel like one brand. Flag conflicts and revise.

6. Prepare the launch

Create a landing-page headline, one-line pitch and social launch content without breaking the selected personality.

Techniques you may use

- Prompt chains and structured JSON outputs
- Agent roles and debate or critique loops
- Retrieval from trusted brand references
- Multimodal inputs or generated visuals
- Scoring, evaluation and consistency tests
- Human review, selection and revision controls

What judges should be able to see

Explain the stages, the information passed between them, the decisions made by AI and the checks used to reduce generic or inconsistent output. A named model alone is not an AI workflow.

SECTION 04

Possible product directions

Your project does not need to be a standard logo generator. Original combinations and focused use cases are encouraged.

Brand Interviewer	An adaptive founder interview that asks high-value follow-up questions before suggesting a direction.
Brand Doctor	Analyze an existing brand, find inconsistencies and propose a more coherent strategy and identity.
Brand Battle	Generate radically different positioning directions and let specialized agents debate their strengths.
Audience Shifter	Reframe one product for different audiences while protecting the underlying value proposition.
Anti-Generic Engine	Detect cliches and repeatedly challenge weak naming, language or visual ideas until they improve.
Consistency Guardian	Check future pages, posts or campaigns against an established brand system and explain violations.
Founder-to-Launch Kit	Turn a short idea into a practical brand kit with strategy, voice, visuals and launch content.
One Idea, Five Worlds	Create five strategically different identity directions, such as editorial, playful, luxury or technical.

Build rules

- Build the project during the official build window and submit before the stated deadline.
- A substantially completed pre-existing project may be disqualified. Clearly disclose major pre-existing work.
- You may use AI coding tools, LLMs, public APIs, frameworks, open-source libraries, UI libraries, templates and boilerplate.
- Respect licenses, API terms, privacy and platform rules. Never present third-party work as your own.
- Inkloom integration is not required and is not a judging criterion because the platform is still under development.
- Late, inaccessible, misleading or incomplete submissions may not be evaluated.

SECTION 05

Submission requirements

The project may be shared by the team, but the final submission is individual. Every participant - not only the team leader - must complete the form and submit their own publication links.

Every participant must submit

One form from the team leader is not enough. Every participant must enter the same team name and project name, identify their own role and contribution, and provide links to their own Instagram project content and LinkedIn project post. Another member's post cannot be reused.

A. Team project information

- Project name and team name
- One-line description
- Problem being solved
- Detailed solution and target users
- Distinctive or original features
- Tech stack, models and APIs
- Prompt architecture and AI workflow
- Agents, chains or evaluation methods

B. Required project links

- Public or judge-accessible GitHub repository
- Live deployed product link
- Demo video link
- All required social-post links

C. Every member submits individually

- Full name and email
- Team name and project name
- Specific role in the team
- What they personally built
- GitHub, live product and demo links
- Own Instagram project-post / reel link
- Own LinkedIn project-post + video link
- Inkloom signup, website and credit code included

D. The posts are mandatory evidence

The social posts prove what each participant built, explain the individual's contribution and credit the event partner correctly. Missing, private, copied or inaccessible post links make that participant's submission incomplete.

Contribution descriptions must be specific

Good example

Role: Backend and AI workflow. Contribution: designed the multi-stage prompt pipeline, implemented the API endpoints, integrated the language model and validated the structured outputs.

Writing only 'team member' or 'helped with the project' is not enough to evaluate an individual contribution.

SECTION 06

Demo and publication requirements

These publications are part of the submission, not optional promotion. Each participant must publish both items from their own account and submit both links.

Demo video

Recommended length: 2-4 minutes. Show the actual product, not only slides.

1	Problem	Explain the user and need.
2	Product	Show the working interface.
3	Input	Enter a realistic user idea.
4	AI workflow	Explain the stages and reasoning.
5	Output	Show the generated brand system.
6	Difference	Highlight the strongest original feature.

Two required publications - per participant

Platform	Publication	Must include
Instagram	Project content / reel	Any suitable video or visual format; the caption must contain the required project, Inkloom and collaboration details.
LinkedIn	Project + video + Inkloom	Upload the demo directly; explain the build and include Inkloom's description, signup URL, credit code and call to action.

Submission status

Both personal post links are compulsory. The team leader's posts do not cover the other members. If either required post or link is missing, that participant's submission is incomplete.

SECTION 07A

Instagram project content

The video or visual format is flexible. The caption requirements are not. Replace every bracketed field and send the collaboration request to @wecodecoderss.

COPY TEMPLATE**Instagram project demo / reel caption**

[Name of Hackathon] x inkloom.art

You may upload a product demo, screen recording, explanation, build journey, behind-the-scenes edit or another suitable video/visual. The creative format is your choice, but the caption must include the information below.

We built [Project Name] - [clear one-line description]. It helps [target user] solve [specific problem] by [how the solution works].

Key feature: [strongest feature]

My role: [role]

My contribution: [specific work]

Tech and AI used: [tools, models and APIs]

Inkloom is the title/presenting sponsor supporting this opportunity for builders.

Visit: inkloom.art | Early-access code: INKLOOM-WCC

Our project will be mentioned on Inkloom's page. Send this post as a collaboration request to @wecodecoderss so it can also be featured by We Code Coders.

Demo / project link: [link]

[Tag official Inkloom account] @wecodecoderss

Creative freedom, mandatory caption

You may use a demo, voice-over, screen recording, slideshow, team explanation, build journey or another suitable format. The caption must still identify the project, problem, role, contribution, technology, Inkloom website, code, official tags and collaboration request.

SECTION 07B

LinkedIn project post - project and demo video

This single LinkedIn post combines the technical project story, direct demo-video upload, Inkloom introduction, signup link and participant credit code.

COPY TEMPLATE**LinkedIn project post - what you built**

[Name of Hackathon] x inkloom.art

Our team built [Project Name], a [type of product] designed for [target users]. It addresses [specific problem] by [one-sentence solution].

How it works: The user [input or first action]. Our system then [main processing / AI workflow]. It returns [useful output or result].

What we actually built:

1. [Feature and what it does]
2. [Feature and what it does]
3. [Feature and what it does]

Technology: [frontend, backend, database, models and APIs]

My contribution: [role plus specific work completed]

What makes it different: [original feature, workflow or insight]

About Inkloom: Inkloom is an AI-native generative design intelligence platform that transforms a company name, business context and creative direction into distinctive logo concepts and brand-ready visual identities.

Inkloom is the title/presenting sponsor supporting this opportunity. Sign up at inkloom.art and redeem the participant credit code INKLOOM-WCC to access the announced credits or early-access benefit, subject to availability and eligibility.

Upload the demo video directly with this LinkedIn post - do not publish only a video link.

GitHub: [link] | Live product: [link]

[Tag official Inkloom account] [Tag We Code Coders]

Do not submit only a link

The demo video must be uploaded directly with the LinkedIn project post. The same post must also include Inkloom's description, inkloom.art, the signup call to action and credit code INKLOOM-WCC. GitHub and live-product links do not replace the uploaded video.

SECTION 09

Judging and final checklist

Judging rewards the quality of the AI product and the clarity of the team's execution. Inkloom integration is intentionally not included.

Criterion	Weight	What judges look for
Prompt engineering and AI workflow	25%	Clear stages, context handling, structured outputs and thoughtful evaluation.
Originality	20%	A distinctive approach beyond generic generation.
Working implementation	20%	A reliable end-to-end product that can be demonstrated.
Problem-solving and usefulness	15%	Real value for a defined user and problem.
UI / UX	10%	Clarity, usability and purposeful interaction design.
Demo and explanation	10%	A concise, credible explanation with visible evidence.

Final participant checklist

- [] Built within the official window
- [] Working project submitted
- [] GitHub repository accessible
- [] Live product accessible
- [] Demo video accessible
- [] AI workflow explained
- [] Role and contribution specified
- [] Own Instagram project content published
- [] Own LinkedIn project post + video published
- [] Inkloom description included
- [] Collaboration request sent to @wecodecoderss
- [] Signup CTA, inkloom.art and code included
- [] Official accounts tagged
- [] Every participant submitted individually

Final warning

The team's project entry does not complete any individual's submission. Every participant - not only the team leader - must submit their name, email, team name, project name, role, contribution, project links and both personal post links.

SUBMIT AS A TEAM.

VERIFY EVERY PARTICIPANT INDIVIDUALLY.
